The Tesla turbine is a bladeless centripetal flow turbine patented by Nikola Tesla in 1913. It is referred to as a bladeless turbine. The Tesla turbine is also known as the boundary-layer turbine, cohesion-type turbine, and Prandtl-layer turbine because it uses the boundary-layer effect and not a fluid impinging upon the blades as in a conventional turbine. Bioengineering researchers have referred to it as a multiple-disk centrifugal pump. One of Tesla's desires for implementation of this turbin

If you're looking for guidance for building a boundary layer turbine, here are some patents from 1893-1946 that show many other useful features they might have. Tesla didn't apply for his turbine patent until 1909, but he said he first conceived his bladeless boundary layer turbine in 1884, so it seems likely he inspired all of these patents if he was not also a more direct source of them.

But in 1913, Tesla received a patent for what he described as his most important invention. That invention was a turbine, known today as the Tesla turbine, the boundary layer turbine or the flat-disk turbine. Interestingly, using the word "turbine" to describe Tesla's invention seems a bit misleading.
