Time Series: Theory and Methods by Peter J. Brockwell

Unlike our earlier book, Time Series:
Theory and Methods, re-ferred to in the
text as TSTM, this one requires only a
knowledge of basic calculus, matrix
algebra and elementary statistics at the
level (for example) of Mendenhall,
Wackerly and Scheaffer (1990). It is
intended for upper-level undergraduate
students and beginning graduate
students.

The notion is that the series can be decomposed into four elements: Trend (Tt) — long term movements in the mean; Seasonal effects (It) — cyclical fluctuations related to the calendar; Cycles (Ct) — other cyclical fluctuations (such as a business cycles); Residuals (Et) — other random or systematic fluctuations.

Time series theory is a mixture of probabilistic and statistical concepts. The probabilistic part is to study and characterize probability distributions of sets of variables X_t that will typically be dependent. The statistical problem is to determine the probability distribution of the time series given observations X_1, \dots, X_n at times $1, 2, \dots, n$. The
