Some of the most powerful examples of biocatalytic applications exploit the chiral nature of these catalysts. In fact, the R and S nomenclature commonly used to define the orientation of substituents of a chiral center as popularized by Prelog and others was first described in the context of the products formed by the reduction of prochiral ketones by alcohol dehydrogenases (ADHs).

Aldolases are emerging as powerful and cost efficient tools for the industrial synthesis of chiral molecules. They catalyze enantioselective carbon-carbon bond formations, generating up to two chiral centers under mild reaction conditions. Despite their versatility, narrow substrate ranges and enzyme inactivation under synthesis conditions represented major obstacles for large-scale applications of aldolases.
