set of values. Continuous-time signals are characterised by independent variables that are continuous and define a continuous set of values. Usually the variable indicates the continuous time signals, and the variable n indicates the discrete-time system. Also the independent variable is enclosed at parentheses for continuous-time signals

Discrete-time and continuous-time signals - Student Circuit

A continuous signal or a continuous-time signal is a varying quantity (a signal) whose domain, which is often time, is a continuum (e.g., a connected interval of the reals). That is, the function's domain

variable that has countable or finite set of numbers in its sequence". It is a digital representation of continuous-time signal. The discrete-time signal can be represented and defined at certain instants of time in its sequence. That is, the discrete-time signal is able to define only at the sampling instants.

For any continuous-time signal $x(t)$ or any discrete-time signal $x[n]$, the total energy over the time interval $t_1 \leq t \leq t_2$ in a continuous-time signal $x(t)$ is defined as:

$$\int_{t_1}^{t_2} |x(t)|^2 dt, \quad (1.4)$$

Discrete-Time Signals

The theory of discrete- and continuous-time signals and systems is similar, but there are significant differences. As functions of an integer variable, discrete-time signals are naturally discrete or obtained from analog signals by sampling.

Continuous-Time Signal - an overview | ScienceDirect Topics

A continuous-time signal will contain a value for all real numbers along the time axis. In contrast to this, a discrete-time signal, often created by sampling a continuous signal, will only have values at equally spaced intervals along the time axis. Figure 1.1. 1
