Escape Velocity of Earth: From the above equation, the escape velocity for any planet can be easily calculated if the mass and radius of that planet are given. For earth, the values of g and R are: g = 9.8 m. R = 63,781,00 m. So, the escape velocity will be: \(v_{e}=\sqrt{2\times 9.8\times 63,781,00}\) Escape Velocity of Earth= 11.2 km/s.

Derivation of Escape Velocity - Check Escape Velocity ...
On the surface of the Earth, the escape velocity is about 11.2 km/s, which is approximately 33 times the speed of sound (Mach 33) and several times the muzzle velocity of a rifle bullet (up to 1.7 km/s). However, at 9,000 km altitude in "space", it is slightly less than 7.1 km/s.

Escape velocity - Wikipedia
v_ {e}=\sqrt {2gr} Where, g=\frac {GM} {r^ {2}} The escape speed of the earth at the surface is approximately 11.186 km/s. That means " an object should have a minimum of 11.186 km/s initial velocity to escape from earth's gravity and fly to infinite space.".
