Stress affects core body temperature (T c). Many kinds of stress induce transient, monophasic hyperthermia, which diminishes gradually if the stressor is terminated. Stronger stressors produce a longer-lasting effect. Repeated/chronic stress induces anticipatory hyperthermia, reduces diurnal changes in T c, or slightly increases T c throughout the day. Animals that are exposed to chronic stress or a cold environment exhibit an enhanced hyperthermic response to a novel stress.

### Stress-induced hyperthermia and hypothermia

When most people think of hypothermia, they think of frigid temperatures or blizzard like conditions. Actually, hypothermia occurs most often in the spring and fall, rather than winter. Four factors contribute to cold stress: cold temperatures, high or cold wind, dampness and cold water. A cold environment forces the body to work harder to maintain its core temperature of 98.6 o F. Cold air, water, and snow all draw heat from the body.
