One of the most distinctive features of Roman urban planning was its orderly grid of streets constructed in major provincial towns throughout the empire, many of these grids were based on the layout of the military camps (castra) that preceded them. These plans imposed order and uniformity on the landscape and allowed for easy distribution of urban land to Roman colonists.

Evolution of Street Networks in America Beliefs regarding optimal configuration of streets upon which a city is built varied with culture and evolved with the times. The ancient Greeks and Romans built gridiron plans, while other parts of Europe gave rise to organic, meandering, medieval patterns that were eventually brought to the New World.

The street hierarchy is an urban planning technique for laying out road networks that exclude automobile through-traffic from developed areas. It is conceived as a hierarchy of roads that embeds the link importance of each road type in the network topology (the connectivity of the nodes to each other). Street hierarchy restricts or eliminates direct connections between certain types of links ...

The grid plan, grid street plan, or gridiron plan is a type of city plan in which streets run at right angles to each other, forming a grid. The infrastructure cost for regular grid patterns is generally higher than for patterns with discontinuous streets. Costs for streets depend largely on four variables: street width, street length, block width and pavement width.

Street networks may be planned according to clear organizing principles or they may evolve organically through accretion, but their configurations and orientations help define a city's spatial logic and order. Measures of entropy reveal a city's streets' order and disorder. Past studies have explored individual cases of orientation and entropy, but little is known about broader patterns ...
